What is the best way to implement mutliple Default Buttons on a ASP.NET Webform?

I have what I think is a pretty standard page. There is a login area with user/pass field and a login button. Then elsewhere on the same page there is a single search field with a search button.
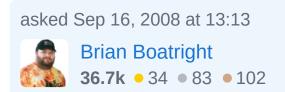

`asp.net`   `webforms`

Pedantry: *multiple Please proofread your posts. At the very least, your subjects. – GEOCHET Sep 16, 2008 at 13:25

It's clear you are smarter than me but I still want to learn whatever lesson you are trying to teach me. Please edit my original question or subject to read as you believe is correct.

Or make another comment. I appreciate the critique.

`asp:Panel` has a property named `DefaultButton`. You just need to encapsulate your markup portions with appropriate panels and set the default buttons for each.

Capture the enter key press for each area of the screen and then fire the corresponding button's click even.

Use a helper function like [this one](#) to tie the textboxes to their associated buttons.
